

## Background

- Major depressive disorder (MDD) and alcohol use disorder (AUD) are prevalent psychiatric conditions known to occur at different rates and have different treatment outcomes in men and women
- MDD and AUD are associated with glutamatergic dysregulation<sup>1</sup>
- an N-methyl d-aspartate glutamate receptor • Ketamine, (NMDAR) antagonist, has shown efficacy in treatment of MDD and AUD<sup>1,9</sup>
- Numerous studies show differences in glutamate system regulation between men and women, suggesting there may be sex-dependent differences in ketamine treatment response<sup>1,2</sup>
- Animal studies suggest NMDAR density is regulated by gonadal hormones- increases during follicular phase/reduces during luteal phase<sup>3</sup>
- The purpose of this review is to summarize the current knowledge of sex-specific outcomes of ketamine treatment for MDD and AUD.

# **Sex Differences in Glutamate Pathologies:** Implications in Ketamine Treatment for Depression and **Alcohol Use Disorder**

Hollis Chillura, Jennifer Jones, M.D. Medical University of South Carolina

| 16        | N=27           | MDD and<br>BD | 0.5 mg/kg<br>ketamine  | HDRS                        | <ul> <li>Men more likely to<br/>reach 50% better<br/>outcomes than women<br/>with ketamine</li> </ul>  |
| 17        | N=108          | Depression    | 0.5 mg/kg<br>ketamine  | HDRS                        | <ul> <li>Gender not associated<br/>with antidepressant<br/>response to ketamine</li> </ul>   |

- potential confounder
- one showed a small sex-based effect
- ketamine treatment outcomes

This work was supported in part by NIH grant R25 DA020537. I would also like to thank my mentor Dr. Jennifer Jones, M.D. and the DART program directors for the opportunity to conduct this research.

### Conclusions

Preclinical studies implicate sex as a moderator of treatment outcomes in MDD and AUD animal models

• However, there were few analyses in human trials of this

• Two of the three clinical trials showed null findings, while

• Future studies should continue to evaluate sex-specific differences and the effects of female hormone levels on

Studies should characterize if female participants are on exogenous hormones- and if so, which type
